

not receive (n=18) PEG feeding. Survival was charted from the time of PEG tube insertion to a maximum of 2 years. Appropriate inclusion and exclusion criteria were well-specified.

The median survival for the PEG group was 59 days, compared with 60 days for the group who did not undergo PEG insertion. An appropriate Kaplan-Meier survival curve did not reveal any statistically significant difference in survival found between the groups. -.72 cm (E) -1 dffoups
